Education

Silicon University, B.Tech in Computer Science and Engineering Sept 2023 – Present
CGPA: 7.49 *Bhubaneswar*

+2 High School Tisri Barahmasiya – Higher Secondary (12th Grade) April 2020 – March 2022
Percentage: 85.2% *Giridih*

Experience

Cybersecurity Intern, CODEBEAT June 2025 – July 2025

- Internship focused on practical cybersecurity topics: networking basics (TCP/IP, OSI model), Linux fundamentals, web basics (HTTP/HTTPS, DNS), footprints & reconnaissance, scanning & enumeration, and gaining access.
- Hands-on practice with password cracking, web application attacks (SQL injection, XSS, RFI), wireless attacks, cryptography basics, and system monitoring.
- Tools & techniques used: Nmap, Metasploit, Burp Suite, John the Ripper, and enumeration utilities.

Course Completed

Web Application Pentesting (Certification) – TryHackMe September 2025

Web Fundamentals (Certification) – TryHackMe May 2025

Jr Penetration Tester (Certification) – TryHackMe April 2025

Projects

RegisMon - Windows Registry Change Monitoring System — Python January 2026
Security Tool

<https://github.com/raj-vishw/RegisMon>

- Developed a Python-based Windows registry monitoring agent to detect key/value modifications and suspicious persistence techniques.
- Designed a config-driven recursive registry scanner with real-time change detection and CLI-based agent control.
- Implemented structured alerting and automated SOC-style reporting to analyze suspicious registry activity.

Custom Payload Encoder & Obfuscation Framework — Python Security January 2026
Research Tool

<https://github.com/raj-vishw/custom-payload-encoder-obfuscator-framework-CPEOF->

- Developed a modular Python framework to encode and obfuscate payloads for studying evasion of static signature-based detections in controlled lab environments.
- Implemented junk insertion, layered encoding, string mutation, and polymorphic payload generation techniques.
- Designed a pluggable architecture enabling easy addition of new obfuscation modules and transformation pipelines.

Automated Vulnerability Scanner — Python Security Scanner November 2025
github.com/raj-vishw/automated-vulnerability-scanner

- Developed a Python vulnerability scanner integrating Nmap and Nikto for network and web application assessment.
- Parsed scan outputs to map CVEs and generate structured vulnerability reports.
- Built a modular, error-tolerant architecture optimized for Kali, Ubuntu, and Parrot OS.

Technologies & Skills

Languages: Python, Java, C, HTML/CSS, SQL

Technical Skills: Cybersecurity fundamentals, Linux, Networking, Web app security, Python scripting, Packet analysis,

Tools: Burp Suite, Wireshark, Nessus, Nmap, Metasploit, John the Ripper, Nikto, Hydra, Netcat, SQLMap, Aircrack-ng, splunk, gobuster, ELK Stack.

Operating System: Windows, Linux, ubuntu
